## 0 引言

对于离子型或以离子键为主的晶体, 其光学和磁学性质可用晶体场理论解释。通过晶场微扰矩阵元的计算, 可定量地确定晶体场光谱带位置。已有资料无矩阵元的计算过程, 只是给出了部分积分结果, 这很容易造成矩阵元的计算有误, 且不利于在任何对称情况下晶场微扰矩阵元的计算。笔者推导了中心对称矿物的晶场势能算符, 对于具  $3d^9$  电子组态的  $\text{Cu}$  对称矿物六配位的晶场微扰矩阵元进行了计算, 给出了矩阵元的表达式和晶场  $d$  轨道能量的计算步骤, 并结合绿松石, 具体计算了晶场  $d$  轨道能量和晶体场谱带位置。

## 1 晶体场势能算符的推导

依晶体场理论, 单电子的晶场势能可表为:

$$V(\mathbf{r}) = \sum_{\lambda=0}^{\infty} \sum_{x=-\lambda}^{\lambda} A_{\lambda x} r^{\lambda} Y_{\lambda x}(\theta, \Phi) \quad (1)$$

式中:  $\mathbf{r}$  为电子的位置矢量;  $r, \theta, \Phi$  为它的球极坐标;  $Y_{\lambda x}$  为球谐函数。若将配体当作等效点电荷看待, 则式(1) 中的系数  $A_{\lambda x}$  可为

$$A_{\lambda x} = - \sum_i \frac{4\pi e^2 \eta}{2\lambda + 1} \frac{1}{R_i^{\lambda+1}} Y_{\lambda x}(\Theta_i, \Phi_i) \quad (2)$$

式中:  $R_i, \Theta_i, \Phi_i$  为第  $i$  个配体的球极坐标,  $e\eta_i$  为第  $i$  个配体的等效电荷。

可以证明,  $\lambda \leq 2l$ , 若  $d$  电子,  $\lambda \leq 4$ ,  $\lambda > 4$  的各项在微扰计算中不作出贡献,  $\lambda X$  均为偶数, 为奇数在微扰计算中也不作出贡献, 故  $V(\mathbf{r})$  的简化形式为

$$V(\mathbf{r}) = A_{00} r^0 Y_{00} + \sum_{x=-2}^2 A_{2x} r^2 Y_{2x} + \sum_{x=-4}^4 A_{4x} r^4 Y_{4x} \quad (3)$$

式中第一项为常数项, 不影响能级间相对距离, 可舍去, 所以

$$\begin{aligned} V(\mathbf{r}) = & A_{20} r^2 Y_{20} + A_{22} r^2 Y_{22} + A_{2-2} r^2 Y_{2-2} + \\ & A_{40} r^4 Y_{40} + A_{42} r^4 Y_{42} + A_{4-2} r^4 Y_{4-2} + \\ & A_{44} r^4 Y_{44} + A_{4-4} r^4 Y_{4-4} \end{aligned} \quad (3)$$

$Y_{\lambda x}$  相当于  $Y_{lm_l}$ , 当  $X = \pm 2, \pm 4$  时, 球谐函数为复数<sup>[1]</sup>,  $A_{\lambda x}$  与  $A_{\lambda-x}$ ,  $Y_{\lambda x}$  与  $Y_{\lambda-x}$  共轭。由于  $A_{\lambda x}^c =$

$A_{\lambda-x}^c$ ,  $Y_{\lambda x}^c = Y_{\lambda-x}^c$ ,  $A_{\lambda x}^s = -A_{\lambda-x}^s$ ,  $Y_{\lambda x}^s = -Y_{\lambda-x}^s$  ( $c, s$

分别表示实部和虚部), 所以

$$\begin{aligned} A_{\lambda x} r^{\lambda} Y_{\lambda x} + A_{-\lambda x} r^{\lambda} Y_{-\lambda x} &= r^{\lambda} \left[ \left( A_{\lambda x}^c + A_{\lambda x}^s \right) \cdot \right. \\ &\quad \left. \left( Y_{\lambda x}^c + Y_{\lambda x}^s \right) + \left( A_{\lambda x}^c - A_{\lambda x}^s \right) \left( Y_{\lambda x}^c - \right. \right. \\ &\quad \left. \left. Y_{\lambda x}^s \right) \right] = r^{\lambda} [2A_{\lambda x}^c Y_{\lambda x}^c + 2A_{\lambda x}^s Y_{\lambda x}^s] \\ V(r) &= A_{20} r^2 Y_{20} + 2A_{22} r^2 Y_{22}^c + 2A_{22} r^2 Y_{22}^s + \\ &\quad A_{40} r^4 Y_{40} + 2A_{42} r^4 Y_{42}^c + 2A_{42} r^4 Y_{42}^s + \\ &\quad 2A_{44} r^4 Y_{44}^c + 2A_{44} r^4 Y_{44}^s \end{aligned} \quad (4)$$

## 2 d 轨道晶体场能级的计算

晶体场能级计算分 4 个步骤:

(1) 确定  $d^n$  组态的谱项及基态能级, 如  $\text{Cu}^{2+}$ , 为  $3d^9$  电子组态, 只有一个光谱项, 也是基态谱项。

(2) 定  $d^n$  组态的各光谱项在各种对称点群作用下, 所产生的不可约表示, 如  $\text{Cu}^{2+}(3d^9)$ , 光谱项在  $O_h$  场中可分裂为  $^2E_g$  和  $^2T_{2g}$ ,  $^2E_g$  为基态, 在  $\text{Ci}$  场中可进一步分裂为  $^2\text{Ag}$  ( $d_{x^2-y^2}$ ),  $^2\text{Ag}$  ( $d_{z^2}$ ),  $^2\text{Ag}$  ( $d_{xy}$ ),  $^2\text{Ag}$  ( $d_{yz}$ ),  $^2\text{Ag}$  ( $d_{xz}$ ),  $^2\text{Ag}$  ( $d_{x^2-y^2}$ ) 为基态。

(3) 确定 5 个  $d$  轨道的波函数。在  $d^n$  体系中每一个电子的总波函数为  $\Psi = R(r)\Theta(\theta)\Phi(\varphi)\Psi_s$ , 考虑到晶体场势能与  $\Psi_s$  无关, 径向函数  $R(r)$  与方向变化无关, 故  $d$  轨道的波函数如表 1。

表 1 d 轨道波函数的角度部分在极坐标中的表示<sup>[2]</sup>

Table 1 Part of the Angle of Wave Function on d Trajectory in Polar Coordinate

$\Phi_{lm_l}$	$N$	$Y_{lm_l}(\theta, \varphi)$	线性组合
$d_{xy}$	$1/\sqrt{15/16}$	$\sin^2 \theta \sin 2\varphi$	$d_{xy} = 1/i\sqrt{2}(d_2 - d_{-2})$
$d_{x^2-y^2}$	$1/\sqrt{15/16}$	$\sin^2 \theta \cos 2\varphi$	$d_{x^2-y^2} = 1/\sqrt{2}(d_2 + d_{-2})$
$d_{xz}$	$1/\sqrt{15/4}$	$\cos \theta \sin \theta \cos \varphi$	$d_{xz} = -1/\sqrt{2}(d_1 - d_{-1})$
$d_{yz}$	$1/\sqrt{15/4}$	$\cos \theta \sin \theta \sin \varphi$	$d_{yz} = -1/i\sqrt{2}(d_1 + d_{-1})$
$d_{z^2}$	$1/\sqrt{2\pi}$	$\sqrt{5/8} 3 \cos^2 \theta - 1$	$d_{z^2} = d_0$

(4) 求  $d$  轨道能量。欲求  $d$  轨道能量, 必须求解  $d$  轨道函数与晶体场算符的矩阵元。考虑到实球谐函数的正交性, 由矩阵元组成的久期行列式为:

$$\begin{vmatrix} H_{11} - \Delta E & H_{12} & H_{13} & 0 & 0 \\ H_{21} & H_{22} - \Delta E & H_{23} & 0 & 0 \\ H_{31} & H_{32} & H_{33} - \Delta E & 0 & 0 \\ 0 & 0 & 0 & H_{44} - \Delta E & H_{45} \\ 0 & 0 & 0 & H_{54} & H_{55} - \Delta E \end{vmatrix} = 0 \quad (5)$$

式中:  $H_{11} = \langle d_{z^2} | V | d_{z^2} \rangle$ ,  $H_{22} = \langle d_{x^2-y^2} | V | d_{x^2-y^2} \rangle$ ,  $H_{33} = \langle d_{xy} | V | d_{xy} \rangle$ ,  $H_{44} = \langle d_{yz} | V | d_{yz} \rangle$ ,  $H_{55} = \langle d_{xz} | V | d_{xz} \rangle$ ,  $H_{12} = H_{21} = \langle d_{z^2} | V | d_{x^2-y^2} \rangle$ ,  $H_{13} = H_{31} = \langle d_{z^2} | V | d_{xy} \rangle$ ,  $H_{23} = H_{32} = \langle d_{x^2-y^2} | V | d_{xy} \rangle$ ,  $H_{45} = H_{54} = \langle d_{yz} | V | d_{xz} \rangle$ 。

依  $d$  轨道波函数(见表 1), 球谐函数<sup>[2]</sup>, 三角函数积分值(表 2, 表 3), 可求积分值  $\int_0^\pi \int_0^{2\pi} Y_{2,m}^*(\theta, \varphi) Y_{\lambda,x}(\theta, \varphi) Y_{2,m}(\theta, \varphi) \sin \theta d\theta d\varphi$ (表 4)。

依表 4 和式(4)可求矩阵元

$$H_{11} = \langle d_z^2 | V | d_z^2 \rangle = \frac{\sqrt{5}}{7\sqrt{\pi}} A_{20} r^2 + \frac{3}{7\sqrt{\pi}} A_{40} r^4$$

$$H_{45} = \langle d_{yz} | V | d_{zx} \rangle = \frac{\sqrt{30}i}{7 \cdot 2\sqrt{\pi}} A_{22}^s r^2 + \frac{\sqrt{10}i}{7\sqrt{\pi}} A_{42}^s r^4 \quad (6)$$

矩阵元求出后, 通过矩阵对角化, 可得  $\Delta E$ , 即  $d$  轨道能量。

### 3.4 $d$ 轨道能量计算

用雅可比方法分别对  $3 \times 3$  和  $2 \times 2$  的实对称矩阵对角化, 求矩阵的 5 个特征值, 即得 5 个  $d$  轨道的能量:  $\Delta E_1(d_{z^2}) = -1835 \text{ cm}^{-1}$ ;  $\Delta E_2(d_{x^2-y^2}) = -9839 \text{ cm}^{-1}$ ;  $\Delta E_3(d_{xy}) = 3619 \text{ cm}^{-1}$ ;  $\Delta E_4(d_{yz}) = 4723 \text{ cm}^{-1}$ ;  $\Delta E_5(d_{xz}) = 3330 \text{ cm}^{-1}$ ,  $d_{x^2-y^2}$  为基态, 其余为激发态, 基态与各激发态能量差为:  $\Delta_1 = \Delta E_1 - \Delta E_2 = 8004 \text{ cm}^{-1}$ ;  $\Delta_2 = \Delta E_5 - \Delta E_2 = 13169 \text{ cm}^{-1}$ ;  $\Delta_3 = \Delta E_3 - \Delta E_2 = 13450 \text{ cm}^{-1}$ ;  $\Delta_4 = \Delta E_4 - \Delta E_2 = 14562 \text{ cm}^{-1}$ , 计算与实验结果见表 5。

光谱数据 <sup>[5]</sup> / cm <sup>-1</sup>	计算结果 / cm <sup>-1</sup>
6 100	$\Delta_1 = 8\ 004$
11 000	$\Delta_2 = 13\ 169$
13 500	$\Delta_3 = 13\ 450$ ( 743 nm)
15 400	$\Delta_4 = 14\ 562$ ( 687 nm)

从表 5 可看出, 绿松石中  $\text{Cu}^{2+}$  晶体场谱带位置在可见光范围内与计算值符合较好。因此, 用晶体场理论可对某些具离子键晶体的呈色机制进行定量研究。

**Abstract:** For the ion model crystals or the crystals in which the ionic bond is dominant, the optic and magnetic features can be interpreted by the crystal field theory. Through the calculation of crystal field minute interference matrix element, the position of crystal field spectra can be defined mensurably. Although some calculation results have been given in literatazes, but the lack of the matriri element calculation procedure is not beneficial for the calculation in any circumstances. This paper de duces the crystal field potential operator on the mineral which has center of symmetry, calculates the integrated value, and gets the matrix element formula expressed by modulus of  $A_{\lambda x}$ ,  $r^2$  and  $r^4$ . On the bas is of the structure data of turquoise, this paper calculates the modulus  $A_{\lambda x}$  of crystal field minute interference matrix element of  $\text{Cu}^{2+}$  and calculate the other ma trix elements. Th rough diagonal manipulation of symmetry matrix, as the result, the authors get the d orbit energy and the position of crystal field spectra of  $\text{Cu}^{2+}$  in turquoise. Compared with the experiment datas, they are consistent. Therefore, combined with the experiment datas, this method can illustrate the color forming mechanism of ion crystal.

**Abstract** Five successive stages of magmatism in the Pingdao granite could be recognized, they are plagiogranite, granodiorite, biotite adamellite, porphyaceous biotite adamellite and syeogranite. The granite, with NK/A = 0.49 ~ 0.62, ANK/C > 1.1, rich muscovite, and corundum when calculated by CIPW, belongs to the aluminium supersaturation and calc alkali series. The  $\text{TiO}_2$ ,  $\text{FeO}$ ,  $\text{MgO}$ ,  $\text{CaO}$ , and  $\text{Na}_2\text{O}$  decrease increasingly but the  $\text{Fe}_2\text{O}_3$  and  $\text{K}_2\text{O}$  increase strongly with the  $\text{SiO}_2$  increasing. Petrochemistry study indicates that the source rocks of the Pingdao granite are graywacke and fragmental rocks and they are rich the LREE, with  $\delta\text{Eu} = 0.35 \sim 0.7$  and intense Eu depletion. Meanwhile, they are poor in Ba, Rb, Sr, Y, Cu, Zr, Ga and Ni, but rich in Nb, Ta, Bi, Th, Cr, Sn, Mo, Hf and Sc, and especially rich in Hf, Sn and Sc. The information of the tectonic geochemistry displays that the Pingdao granite is a intraplate rift type.
